The Human Skeleton: An Overview

The human skeleton serves as the structural framework of the body, providing support, protection, movement, and mineral storage. It consists of approximately 206 bones in an adult, although this number can vary due to anatomical variations and developmental factors.

The skeleton can be broadly categorized into two main parts:

Axial Skeleton

This includes bones that form the central axis of the body:

- Skull (cranium and facial bones)
- Vertebral column (spine)
- Rib cage (ribs and sternum)

Appendicular Skeleton

This includes bones of the limbs and girdles that attach limbs to the axial skeleton:

- Pectoral girdles (clavicles and scapulae)
- Upper limbs (humerus, radius, ulna, carpals, metacarpals, phalanges)
- Pelvic girdle (hip bones)
- Lower limbs (femur, tibia, fibula, tarsals, metatarsals, phalanges)

Understanding the anatomy and development of these bones is fundamental for osteological analysis.

Key Components of Human Osteology

A detailed study of the human skeleton involves examining various bones and their features. Here are some key components:
